

PlanIT Green™

Save money. Save energy. Save the planet.

Server

Why buy new IT hardware when your existing servers can provide you with all the computing power you need to support new applications? **Save money by making more efficient use of your existing software and hardware resources** by consolidating and virtualizing your server environment.

In a non-virtualized environment, business applications are run on specific server hardware that consume computing and power resources even if the applications are idle. However, server virtualization solutions increase resource utilization through pooling, sharing, and clustering on an as-needed basis. This enables your business to **focus resources when and where they're needed** without the limitations imposed by the traditional "one computer per box" model.

Virtualization greatly simplifies your physical IT infrastructure. You get greater management over your technology assets and better flexibility over the allocation of your computing resources. By consolidating your servers on a smaller number of physical computers you **save money on hardware costs, energy costs, and IT support.**

IMPRES Technology will help you make better use of your existing infrastructure:

- Assess your current environment
- Implement consolidation strategies
- Implement virtualization strategies
- Make backup and disaster recovery simpler and faster
- Implement cost tracking and ROI analysis

Help eliminate waste by incorporating green solutions into your technology strategy. Reducing the number of computers required in your server environment will save energy, reduce electronic waste, save time and allow you to utilize your resources in other needed areas. You can make a difference: **PlanIT Green.**
