

PlanIT Green™

Save money. Save energy. Save the planet.

Desktop

Did you know that the computer you have chosen has a dramatic and immediate impact on your monthly energy costs? IDC studies show that **your PC's are wasting between 25% and 35% of the energy required to keep them running.** Even though none of this energy finds its way into your PC components, you still have to pay for it!

A typical PC consumes around 506 kilowatt-hours (kWh) of electricity annually. IMPRES Technology can help you reduce that energy consumption by an average of 200 kWh per PC each year. That is an energy savings of nearly 40%.

By choosing energy efficient computers and implementing energy conserving software, **you can save \$20-\$60 per computer annually.** Multiply that savings by the number of computers in your fleet and the savings add up quickly! Curb your long term energy costs and spend that money in other needed areas.

IMPRES Technology will help you implement an energy and cost savings desktop computer strategy. Call IMPRES today 1-800-652-9686.

- Evaluate your current energy consumption
- Identify usage patterns and areas of waste
- Implement an energy saving software platform
- Create a comprehensive report which quantifies savings and ROI analysis
- Research energy saving computers for future rollouts

Help eliminate waste by incorporating green solutions into your technology strategy. Reducing the amount of energy your PC fleet requires is a great way to save energy and money. Save money, save energy and ultimately save the planet. You can make a difference: **PlanIT Green.**
